UNIVERSITY OF TORONTO'S FORESTS AND TREES

CARBON SEQUESTERED AT HART HOUSE FARM

Carbon sequestration for single trees at Hart House Farm was extrapolated using average carbon sequestration per canopy area values derived using i-Tree ECO software based on tree species and diameter at breast height (DBH) of Neighborwoods© tree monitoring data. Carbon sequestration for woodlands at Hart House Farm was generated using average carbon sequestration per woodland area values derived based on forest successional stage using Vegetation Sampling Protocol (VSP) natural areas field data from southern Ontario.
